Cognition

Focus Score Stimulation Control (Theta:Beta) Normal

Eyes Open	Absolute Power	The Focus Score (Theta/Beta Ratio), is calculated as the average Theta/Beta power ratio at the frontal (Fz) and central (Cz) regions of the brain
-----------	----------------	---

1. Grab the right table
Use the **Absolute Power (μV^2)** table (not Relative). Keep the same state (e.g., Eyes-Open only).
2. Find the four numbers you need
 - **Fz Theta** and **Fz Beta**
 - **Cz Theta** and **Cz Beta**

From your table:

- Fz: Theta **189.5**, Beta **189.2**
 - Cz: Theta **81.2**, Beta **34.6**
3. Compute the Theta/Beta ratio at each site
 - Fz ratio = Theta $\div$ Beta = **189.5 / 189.2 = 1.002**
 - Cz ratio = Theta $\div$ Beta = **81.2 / 34.6 = 2.347**
 4. Average the two site ratios
Focus Score = (Fz ratio + Cz ratio) $\div$ 2
= (1.002 + 2.347) $\div$ 2 = **1.674** $\rightarrow$ **~1.67**
 5. Read the result (common convention)
 - **< 1.5**: tighter, "locked-in" focus band
 - **~1.5–2.5**: generally steady attention; may drift with fatigue/boredom
 - **> 3**: more mind-wandering tendency

Your Focus Score $\approx$ **1.67** $\rightarrow$ generally steady attention, with mild drift under load.

Alpha peak

Eyes Closed	Special	PZ or below - the highest score will be taken
-------------	---------	---

Eyes Closed

Z-scored Alpha Peak

O1 = 10.0

More than 9 is normal

Hence the alpha peak is normal

Alpha:Theta balance

Eyes Closed	Aboslute Power	Alfa:theta at Fz, Cz and PZ check which is the highest and the order of preference Fz higher than Cz PZ	FZ>CZ>PZ is normal
-------------	----------------	---	--------------------

Here's the **Alpha:Theta (α/θ) ratio** at the three sites (Eyes Closed • Absolute Power):

- **Fz:** $\alpha/\theta = 173.3 / 128.0 = 1.35$
- **Cz:** $\alpha/\theta = 433.0 / 108.1 = 4.01$
- **Pz:** $\alpha/\theta = 1029.3 / 132.9 = 7.75$

Order (highest → lowest): Pz > Cz > Fz.

That means posterior (Pz) shows the strongest alpha relative to theta, then central (Cz), then frontal (Fz). If you're comparing to the stated "normal = $Fz > Cz > Pz$," this pattern is the **opposite** (it's posterior-dominant), which is actually common in eyes-closed recordings where alpha typically peaks over parietal/occipital sites.

Stress

Arousal score (Increased)	Eyes Open	Absolute Power	Arousal Score (HighBeta/Beta Rao) is derived from the ratio of High Beta (20-35 Hz) to Beta (12-20 Hz) brainwave frequencies, averaged over the frontal (Fz) and central (Cz) regions of the brain	Less than 1 is normal
---------------------------	-----------	----------------	--	-----------------------

Here's how to compute your **Arousal Score** (hi-Beta / Beta), Eyes Open, from the **Absolute Power** (μV^2) table:

1. Pull the four numbers
 - **Fz:** Beta = **189.2**, hi-Beta = **152.9**
 - **Cz:** Beta = **34.6**, hi-Beta = **37.5**
2. Compute the ratio at each site (hi-Beta ÷ Beta)
 - **Fz ratio** = $152.9 / 189.2 = 0.81$
 - **Cz ratio** = $37.5 / 34.6 = 1.08$
3. Average the two ratios
 Arousal Score = $(0.81 + 1.08) / 2 = 0.946 \rightarrow \sim 0.95$
4. Read the result
 - **< 1.0** = within typical range
 - **≈ 1.0–1.2** = slightly elevated / watch context (fatigue, stress)
 - **> 1.2** = elevated arousal; **> 1.5** = high

Your Arousal Score ≈ 0.95 → not increased (within normal).

Sensory Processing (Reduced)	Eyes Open	Absolute Power	Sensory Processing Score = $\frac{\text{Alpha1 Power (10–12 Hz, EO, P3+Pz+P4)}}{\text{Alpha2 Power (8–10 Hz, EO, P3+Pz+P4)}}$	A ratio of less than 1 is balanced
------------------------------	-----------	----------------	---	------------------------------------

Regeneration & Repair (Alpha modulation)	EO & EC	Relative Power	Alpha Pz (EC-EO)/EC)*100	More than 30% is healthy
--	---------	----------------	--------------------------	--------------------------

Here's your **Alpha Modulation (Regeneration & Repair)** at **Pz** using **Relative Power**:

Step 1 — Pick values (same montage):

- Eyes **Closed (EC)**, Pz, **Alpha = 45.8%**
- Eyes **Open (EO)**, Pz, **Alpha = 10.9%**

Step 2 — Apply the formula:

$$\text{Alpha Modulation} = \frac{\text{EC} - \text{EO}}{\text{EC}} \times 100 = \frac{45.8 - 10.9}{45.8} \times 100 = 76.2\%$$

Result: ~76% alpha modulation at Pz.

Readout: Threshold > **30%** is considered healthy → **yours is robustly healthy**, indicating strong alpha reactivity (good relax/repair shift with eyes closed).

Focus + Attention

Focus Score Theta	Eyes Open	Relative Power	The Focus Score (Theta) represents the average relative power of Theta brainwaves (4-8 Hz) at the frontal (Fz) and central (Cz) regions of the brain.	Less than 20 is normal
-------------------	-----------	----------------	---	------------------------

Focus Score (Theta) — Eyes Open, Relative Power

- Grab the Theta (%) values at **Fz** and **Cz** from the Relative Power table.
 - Fz Theta = 11.8%**
 - Cz Theta = 13.0%**
- Average them:

$$\text{Focus Score (Theta)} = \frac{11.8 + 13.0}{2} = 12.4$$

- Interpret (threshold: < 20% = normal):
 - Your score: 12.4 → Normal** (no excess frontal/central theta).

Alpha:Theta balance	Eyes Closed	Absolute Power	Alfa:theta at Fz, Cz and PZ check which is the highest and the order of preference Fz higher than Cz PZ	Less than 1 is normal
---------------------	-------------	----------------	---	-----------------------

Here's the **Alpha:Theta (α/θ) ratio** at the three sites (Eyes Closed • Absolute Power):

- Fz:** $\alpha/\theta = 173.3 / 128.0 = 1.35$
- Cz:** $\alpha/\theta = 433.0 / 108.1 = 4.01$
- Pz:** $\alpha/\theta = 1029.3 / 132.9 = 7.75$

Order (highest → lowest): Pz > Cz > Fz.

That means posterior (Pz) shows the strongest alpha relative to theta, then central (Cz), then frontal (Fz).

If you're comparing to the stated "normal = Fz > Cz > Pz," this pattern is the **opposite** (it's posterior-dominant), which is actually common in eyes-closed recordings where alpha typically peaks over parietal/occipital sites.

Focus Stimulus Control, Theta Beta Ratio	Eyes Open	Absolute Power	The Focus Score (Theta/Beta Rao), is calculated as the average Theta/Beta power ratio at the frontal (Fz) and central (Cz) regions of the brain, reflects the balance between Theta (4-8 Hz) and Beta (15-20 Hz) brainwave activities.	Less than 1.5 is normal
---	-----------	-------------------	--	-------------------------

Focus Stimulus Control — Theta/Beta Ratio (Eyes Open, Absolute Power)

- Pull the values from the table
 - Fz:** Theta = $189.5 \mu V^2$, Beta = $189.2 \mu V^2 \rightarrow \Theta/\beta = 189.5/189.2 = 1.002$
 - Cz:** Theta = $81.2 \mu V^2$, Beta = $34.6 \mu V^2 \rightarrow \Theta/\beta = 81.2/34.6 = 2.347$
- Average the two site ratios

$$\text{Focus Score} = \frac{1.002 + 2.347}{2} = 1.674 (\approx 1.67)$$

Interpretation (normal < 1.5): your score ≈ 1.67 , a little above the “locked-in focus” band. Practically: you can focus well, but multitasking, boredom, or sleep debt may nudge you toward mild drift.

Burnout + Fatigue

Arousal Score [High]	Eyes Open	Absolute power	Arousal Score (HighBeta/Beta Rao) is derived from the ratio of High Beta (20-35 Hz) to Beta (12-20 Hz) brainwave frequencies, averaged over the frontal (Fz) and central (Cz) regions of the brain	Less than 1 is normal
----------------------	-----------	----------------	--	-----------------------

Here's how to compute your **Arousal Score** (hi-Beta / Beta), Eyes Open, from the **Absolute Power** (μV^2) table:

2. Pull the four numbers
 - **Fz:** Beta = **189.2**, hi-Beta = **152.9**
 - **Cz:** Beta = **34.6**, hi-Beta = **37.5**
3. Compute the ratio at each site (hi-Beta ÷ Beta)
 - **Fz ratio** = $152.9 / 189.2 = 0.81$
 - **Cz ratio** = $37.5 / 34.6 = 1.08$
5. Average the two ratios
 Arousal Score = $(0.81 + 1.08) / 2 = 0.946 \rightarrow \sim 0.95$
6. Read the result
 - **< 1.0** = within typical range
 - **$\approx 1.0-1.2$** = slightly elevated / watch context (fatigue, stress)
 - **> 1.2** = elevated arousal; **> 1.5** = high

Your Arousal Score $\approx 0.95 \rightarrow$ not increased (within normal).

Relaxation Score	Eyes Closed	Relative power	EC Alpha EC Beta at the Pz rel power	More than 10 is healthy
------------------	-------------	----------------	---	-------------------------

Relaxation Score — Eyes Closed (Relative Power, Pz)

Definition: **Alpha/Beta ratio at Pz (EC)**. Threshold: **> 10 = healthy**.

From your EC Relative Power table (Pz row):

- Alpha = **45.8%**

- Beta = 4.6%

Compute:

$$\text{Relaxation Score} = \frac{\alpha}{\beta} = \frac{45.8}{4.6} = 9.96 (\approx 10.0)$$

Interpretation: ~10.0, essentially right at the **healthy** threshold—posterior alpha reactivity is strong, with beta kept low in EC.

Excessive Delta [High]	Eyes Open	Relative power	The Excessive Delta Indicator score is calculated as the average relative Delta power from multiple EEG locations including Fz, C3, Cz, C4, P3, Pz, and P4.	Less than 70% is normal
------------------------	-----------	----------------	---	-------------------------

Excessive Delta Indicator — Eyes Open (Relative Power)

1) Pick the channels & values (Delta %):

Fz 25.0, C3 15.3, Cz 32.7, C4 8.8, P3 21.0, Pz 29.9, P4 19.4

2) Average them:

$$\text{Score} = \frac{25.0 + 15.3 + 32.7 + 8.8 + 21.0 + 29.9 + 19.4}{7} = 21.73\%$$

3) Interpretation (normal < 70%): 21.7% → **Normal** (no excessive delta in EO).

Emotional Regulation

Alpha Asymmetry Frontal	Eyes Closed	Absolute Power	Frontal Alpha Asymmetry=AlphaF4 + AlphaF3 / AlphaF4 - AlphaF3	Less than 1 is normal
-------------------------	-------------	----------------	---	-----------------------

Frontal Alpha Asymmetry — Eyes Closed (Absolute Power)

From your table:

- **F3 α = 55.4 μV^2**
- **F4 α = 40.3 μV^2**

There are a few common ways this metric is computed. I'll show the two you're most likely to use and the result for each:

1. **Ratio method (F4 / F3)** — simple and matches your “< 1 is normal” rule.

$$FAA_{\text{ratio}} = \frac{\alpha_{F4}}{\alpha_{F3}} = \frac{40.3}{55.4} = \mathbf{0.73}$$

Interpretation: $0.73 < 1 \rightarrow$ **normal** (slightly more left-frontal alpha than right, i.e., relatively more right-frontal activation).

2. **Log-difference method** (widely used in research):

$$FAA_{\ln} = \ln(\alpha_{F4}) - \ln(\alpha_{F3}) = \ln(40.3) - \ln(55.4) \approx \mathbf{-0.32}$$

Interpretation: Negative value indicates **greater right-frontal activation** than left (consistent with the ratio above).

Arousal Score	Eyes Open	Absolute Power	Arousal Score (HighBeta/Beta Rao) is derived from the rao of High Beta (20-35 Hz) to	Less than 1 is normal
---------------	-----------	----------------	--	-----------------------

			Beta (12-20 Hz) brainwave frequencies, averaged over the frontal (Fz) and central (Cz) regions of the brain	
--	--	--	---	--

Here's how to compute your **Arousal Score** (hi-Beta / Beta), Eyes Open, from the **Absolute Power (μV^2)** table:

3. Pull the four numbers
 - **Fz:** Beta = **189.2**, hi-Beta = **152.9**
 - **Cz:** Beta = **34.6**, hi-Beta = **37.5**
4. Compute the ratio at each site (hi-Beta ÷ Beta)
 - **Fz ratio** = 152.9 / 189.2 = **0.81**
 - **Cz ratio** = 37.5 / 34.6 = **1.08**
7. Average the two ratios
Arousal Score = (0.81 + 1.08) / 2 = **0.946** → **~0.95**
8. Read the result
 - **< 1.0** = within typical range
 - **≈1.0–1.2** = slightly elevated / watch context (fatigue, stress)
 - **> 1.2** = elevated arousal; **> 1.5** = high

Your Arousal Score ≈ 0.95 → not increased (within normal).

Regeneration Alpha Modulation	EO & EC	Relative power	Alpha Pz (EC-EO)/EC)*100	More than 30% is healthy
----------------------------------	---------	-------------------	--------------------------	--------------------------------

Regeneration – Alpha Modulation (Pz) • Relative Power

$$(EC - EO) / EC \times 100$$

Formula:

Pick values (Pz):

- **EC Alpha** = 45.8%
- **EO Alpha** = 10.9%

Compute:

$$\frac{45.8 - 10.9}{45.8} \times 100 = \frac{34.9}{45.8} \times 100 = \mathbf{76.2\%}$$

Result: ~76%, which is **well above the 30% healthy threshold** → strong alpha reactivity (good relax/repair shift with eyes closed).

Learning

Peak Alpha	Eyes Closed	Special	PZ or below - the highest score will be taken	More than 9 is normal
------------	-------------	---------	---	-----------------------

Eyes Closed

Z-scored Alpha Peak

O1 = 10.0

More than 9 is normal

Hence the alpha peak is normal

Focus, Theta:Beta Ratio	Eyes Open	Relative power	The Focus Score (Theta/Beta Rao), is calculated as the average Theta/Beta power ratio at the frontal (Fz) and central (Cz) regions of the brain, reflects the balance between Theta (4-8 Hz) and	Less than 1.5 is normal
-------------------------	-----------	----------------	--	-------------------------

			Beta (15-20 Hz) brainwave acvies.	
--	--	--	-----------------------------------	--

3. Grab the right table
Use the **Absolute Power (μV^2)** table (not Relative). Keep the same state (e.g., Eyes-Open only).
4. Find the four numbers you need
 - **Fz Theta** and **Fz Beta**
 - **Cz Theta** and **Cz Beta**

From your table:

- Fz: Theta **189.5**, Beta **189.2**
 - Cz: Theta **81.2**, Beta **34.6**
4. Compute the Theta/Beta ratio at each site
 - Fz ratio = Theta $\div$ Beta = **189.5 / 189.2 = 1.002**
 - Cz ratio = Theta $\div$ Beta = **81.2 / 34.6 = 2.347**
 6. Average the two site ratios
Focus Score = (Fz ratio + Cz ratio) $\div$ 2
= (1.002 + 2.347) $\div$ 2 = **1.674** $\rightarrow$ **~1.67**
 7. Read the result (common convention)
 - **< 1.5**: tighter, "locked-in" focus band
 - **~1.5–2.5**: generally steady attention; may drift with fatigue/boredom
 - **> 3**: more mind-wandering tendency

Your Focus Score $\approx$ **1.67** $\rightarrow$ generally steady attention, with mild drift under load.

			Arousal Score (HighBeta/Beta Rao) is derived from the rao of High Beta (20-35 Hz) to Beta (12-20 Hz) brainwave frequencies, averaged over the frontal (Fz) and central (Cz) regions of the brain	
Arousal score	Eyes Open	Absolute Power		Less than 1 is normal

Here's how to compute your **Arousal Score** (hi-Beta / Beta), Eyes Open, from the **Absolute Power (μV^2)** table:

4. Pull the four numbers
 - **Fz: Beta = 189.2**, hi-Beta = **152.9**
 - **Cz: Beta = 34.6**, hi-Beta = **37.5**

5. Compute the ratio at each site (hi-Beta ÷ Beta)

- **Fz ratio** = $152.9 / 189.2 = 0.81$
- **Cz ratio** = $37.5 / 34.6 = 1.08$

9. Average the two ratios

$$\text{Arousal Score} = (0.81 + 1.08) / 2 = 0.946 \rightarrow \sim 0.95$$

10. Read the result

- **< 1.0** = within typical range
- **≈ 1.0–1.2** = slightly elevated / watch context (fatigue, stress)
- **> 1.2** = elevated arousal; **> 1.5** = high

Your Arousal Score ≈ 0.95 → not increased (within normal).

Creativity

Relaxation Score	Eyes Closed	Relative power	EC Alpha EC Beta at the PZ rel power	More than 10 is healthy
------------------	-------------	----------------	--------------------------------------	-------------------------

Relaxation Score — Eyes Closed (Relative Power, Pz)

Definition: **Alpha/Beta ratio at Pz** (EC). Threshold: **> 10 = healthy**.

From your EC Relative Power table (Pz row):

- Alpha = **45.8%**
- Beta = **4.6%**

Compute:

$$\text{Relaxation Score} = \frac{\alpha}{\beta} = \frac{45.8}{4.6} = \mathbf{9.96} (\approx \mathbf{10.0})$$

Interpretation: ~**10.0**, essentially right at the **healthy** threshold—posterior alpha reactivity is strong, with beta kept low in EC.

Focus, Theta Beta	Eyes Open	Absolute Power	The Focus Score (Theta/Beta Ratio), is calculated as the average Theta/Beta power ratio at the frontal (Fz) and central (Cz) regions of the brain	Less than 1.5 is normal
-------------------	-----------	----------------	---	-------------------------

5. Grab the right table
Use the **Absolute Power (μV^2)** table (not Relative). Keep the same state (e.g., Eyes-Open only).
6. Find the four numbers you need
 - **Fz Theta** and **Fz Beta**
 - **Cz Theta** and **Cz Beta**

From your table:

- Fz: Theta **189.5**, Beta **189.2**
 - Cz: Theta **81.2**, Beta **34.6**
5. Compute the Theta/Beta ratio at each site
- Fz ratio = Theta ÷ Beta = **189.5 / 189.2 = 1.002**
 - Cz ratio = Theta ÷ Beta = **81.2 / 34.6 = 2.347**
8. Average the two site ratios
- Focus Score = (Fz ratio + Cz ratio) ÷ 2
- = (1.002 + 2.347) ÷ 2 = **1.674** → **~1.67**
9. Read the result (common convention)
- **< 1.5**: tighter, “locked-in” focus band
 - **~1.5–2.5**: generally steady attention; may drift with fatigue/boredom
 - **> 3**: more mind-wandering tendency

Your Focus Score ≈ **1.67** → generally steady attention, with mild drift under load.
