

PERSONALIZED NEURO-PROFILE

Neuro Performance Report

A complete map of your brainwave activity, cognitive performance, and dominant brain type — built from 19-channel qEEG analysis and the NeuroSense five-type framework.

NAME

19 Jun 2026

BRAIN TYPE

Sentinel

REPORT ID

NS-2739483

WELCOME, NEUROSENSE

What's **inside** this report

A complete walkthrough of how your brain works — from the dominant brainwave patterns across 19 EEG channels, to your unique brain type, to a personalized 30-day plan.

1 Your Snapshot — at-a-glance score & key signals PAGE 3

2 Brainwave Profile — Delta, Theta, Alpha, Beta, hi-Beta PAGE 4

3 Your Brain Type — the NeuroSense five-type framework PAGE 5–7

4 Performance Markers — Cognition, Focus, Stress, Burnout PAGE 8

5 Emotional Regulation, Learning & Creativity PAGE 9

6 Deep-Dive Neuro-Metrics PAGE 10

7 Your 30-Day Brain Optimization Plan PAGE 11

★ How to read this report

Each metric is shown as a percentage or raw EEG value. Higher isn't always better — for stress regulation, higher means calmer. Look for the colored status badges on every card. Your **Brain Type** on page 5 is the lens through which every score should be interpreted.

SECTION 1 — QUICK READ

Your brain at a glance

Your overall brain performance stands at 67 — solid middle ground, with an exceptional standout in stress regulation (100%) that sets you apart from your brain type. Your watch zone is emotional regulation (33%), paired with a nervous system that runs perpetually alert; the gap between your stress tolerance and your recovery capacity is the key story.

Your three biggest signals

□ **Exceptional stress regulation under load**

- ✓ Your brain activates and deactivates the stress response cleanly — pressure clarifies rather than overwhelms. Sentinel brains typically struggle here; yours doesn't.
- ✓ Healthy alpha peak at 11.6 Hz supports clear thinking and rapid processing, even when the stakes are high.

⚠ **Emotional regulation and chronic arousal**

- ! Emotional regulation at 33% signals significant difficulty managing reactivity and recovery. Right-shifted frontal alpha asymmetry (-9.97) mirrors this — your brain tilts toward worry and threat-monitoring.
- ! Elevated arousal (2.24) paired with low relaxation (2.47) means your nervous system stays "on" even at rest, draining emotional bandwidth fast.

□ **Brain Type**

- Type 5 — Sentinel, with secondary Driver traits.
- The vigilant, prepared brain

SECTION 2 — THE FIVE BANDS

Your brainwave profile

Your brain produces five distinct rhythms simultaneously, each tied to a different mental state. The mix tells us what kind of brain you have. Below is your relative power across the spectrum, recorded in the eyes-closed condition.

Relative Power Distribution

What this means for you

Healthy alpha peak (11.6 Hz)

Your alpha rhythm sits in the sweet spot — upper end of normal. This supports clear thinking, working memory, and the ability to focus without fatigue. A genuine cognitive asset.

Elevated beta and hi-beta (18% + 16%)

Higher fast-wave activity shows your brain is perpetually in planning and problem-solving mode — constantly scanning, organizing, preparing. Excellent for output; exhausting without downtime.

Moderate theta (16%) — well-regulated

Theta is in a healthy range. Not so high that you drift into mental fog; not so low that creativity is starved. The alpha:theta balance supports memory and learning without compromise.

Elevated delta (22%) — recovery marker

Daytime delta at 22% is borderline high (optimal < 20%). Combined with low regeneration (20%), this signals recovery debt — your brain is producing slow waves, but not clearing them efficiently.

SECTION 3 — THE NEUROSENSE FRAMEWORK

The five brain types

Decades of brain imaging and qEEG research show that brains organize into recognizable patterns — distinct combinations of arousal, regulation, and reactivity. Knowing your type isn't a label — it's a lens. It tells you which strategies will actually work for your brain.

				YOUR TYPE
				
TYPE 1	TYPE 2	TYPE 3	TYPE 4	TYPE 5
Steady	Explorer	Driver	Empath	Sentinel
Focused, flexible, emotionally even. Shows up on time, follows through, plays by the rules. The well-regulated brain.	Creative, risk-taking, novelty-seeking. Lower prefrontal regulation — easily bored, struggles with routine and follow-through.	Driven, strong-willed, reliable. High arousal channelled into output. Sees things through. Tends to lock onto thoughts and grind on problems.	Empathetic, deeply feeling, relationship-driven. High limbic reactivity. Prone to mood swings and emotional intensity.	Prepared, motivated, thorough. Heightened activity in vigilance circuits (amygdala, basal ganglia). Worry-prone but reliable.

How we determined your type

Your qEEG showed signatures that map onto the **Sentinel (Type 5)** profile, with secondary **Driver** features:

- Right-shifted frontal alpha asymmetry (-9.97) — the signature of Sentinel-type vigilance. Your brain leans into threat-detection and worry, particularly on the right side of the prefrontal cortex.
- High arousal (2.24) with very low relaxation (2.47) — the nervous system is locked in a prepared, scanning state. Combined with low regeneration (20%), this is classic Sentinel wiring: always ready, rarely fully rested.
- Exceptional stress regulation (100%) overlaid on high arousal — unusual and clinically important. You don't crumble under pressure; instead, you channel the vigilance productively. This is the Driver secondary influence: the ability to convert anxiety into reliable output.
- Healthy cognition (67%) and alpha peak (11.6 Hz) — rules out the low-PFC patterns. Your brain is capable; the issue is recovery, not processing power.

NEUROSENSE'S BRAIN TYPE

Type 5 — The Sentinel Brain

The vigilant, prepared brain.

Prepared

Goal-Oriented

High Drive

Vigilant

Reliable

What's happening in your brain

□ The neuroscience

Brain-imaging research shows the Sentinel brain has heightened activity in the basal ganglia, insular cortex, and amygdala — the threat-detection circuits — often linked to lower GABA. Your qEEG mirrors this: high arousal, right-frontal alpha asymmetry, and low regeneration. The nervous system stays "on," scanning for what could go wrong.

□ Why it's a strength

Sentinel brains are the people you want planning your wedding or running operations. You see risk before it arrives, you prepare, and you finish what you start. The same vigilance that costs recovery is what makes you exceptionally reliable.

Your strengths & watch-zones

□ Sentinel-Brain Strengths

- ✓ Reliable and prepared — you don't drop balls; people trust your follow-through.
- ✓ Risk-aware and goal-driven — you see what others miss and don't quit once committed.
- ✓ Strong stress tolerance — a real advantage over most Sentinel-type brains.

□ Sentinel-Brain Watch-Zones

- ! Mental "always-on" mode — the mind doesn't switch off; falling asleep can feel hard.
- ! Anticipatory worry — what-ifs run in the background, reducing emotional bandwidth.
- ! Recovery debt — low regeneration means you spend energy faster than you replenish.

WHAT WORKS FOR YOUR TYPE

Sentinel-brain strategy guide

Generic advice often fails this type. Here's what actually moves the needle for a Sentinel brain.

Lifestyle & nutrition

□ Eat for your type

Sentinel brains do best with a balanced diet rich in complex carbohydrates (which raise serotonin) plus moderate protein. Foods rich in magnesium (leafy greens, almonds, dark chocolate) support GABA. Limit caffeine — it amplifies your already-active arousal.

□ Move

Skip extreme HIIT for now — it spikes the same arousal you're trying to lower. Choose walking, swimming, yoga, tai chi, or light cycling. Aim for daily movement that finishes with you feeling calmer than you started.

🧠 Sleep

Your low regeneration score makes sleep non-negotiable. No screens 60 min before bed. Cool, dark room. Same wake-time daily. Consider magnesium glycinate at night (after a chat with your doctor).

Mind & emotional practices

✓ Do more of

- ✓ 4-7-8 breathing — twice daily for 4 cycles. Activates parasympathetic tone.
- ✓ Worry journaling — 10 min before bed. Sentinel brains sleep better when worries are "contained."
- ✓ Box breathing before any high-stakes task.
- ✓ Cognitive reframing — for every "what could go wrong," add "what could go right."

⚠ Less of

- ! Caffeine after noon — extends your already-elevated arousal into the night.
- ! Doom-scrolling news — primes the threat-monitoring circuits already running hot.
- ! Saying yes when you mean no — Sentinel brains over-commit; boundaries protect your nervous system.
- ! Late-night problem-solving — your brain gnaws on it. Park it; tackle after sleep.

SECTION 4 — PERFORMANCE MARKERS

Cognition & stress

How clearly you think and how well you handle pressure — the two engines of daily performance.

□ Cognition

67%

MODERATE

Solid cognitive engine at 67%. Memory, learning, and reasoning work well. Your healthy alpha peak (11.6 Hz) and balanced alpha:theta ratio support clear thinking even under load.

✂ Stress Regulation

100%

EXCELLENT

A standout strength — 100%. Your brain activates and deactivates the stress response without getting stuck. Most Sentinel-type brains struggle with pressure; yours converts it into reliable action.

□ Focus & Attention

67%

MODERATE

Good baseline focus at 67%. Your risk is that vigilance pulls attention sideways — onto worries rather than the task at hand. Anchoring techniques (Pomodoro, single-focus blocks) will help.

□ Burnout Resistance

67%

MILD LOAD

Mild load (67%). You're managing well, but recovery isn't keeping pace with output. Combined with low regeneration (20%), this is the metric to watch over the next month.

Worth understanding

This is the most clinically interesting finding on your report. Sentinel-type brains typically show poor stress regulation because the limbic system is hyperactive and drains executive function. Your data is different — and that matters. Your high arousal (2.24) and low relaxation (2.47) sit alongside exceptional stress regulation (100%). The interpretation: you're not overwhelmed by stress; you're fueled by it. Somewhere along the way, you've learned to convert vigilant energy into productive action. This is the Driver secondary wiring in your profile. The catch: burning high-octane fuel works until it doesn't. Without active recovery, the same arousal that powers your reliability becomes the source of irritability, insomnia, and eventual burnout. Your job isn't to lower your drive — it's to build the recovery your current system urgently needs.

SECTION 5 — INNER BANDWIDTH

Emotion, learning & creativity

When the nervous system is busy scanning, it has less bandwidth for emotional flexibility, divergent thinking, and the open-mode states that drive creativity.

□ Emotional Regulation

33%

NEEDS ATTENTION

Emotional regulation at 33% is your primary concern. The right-frontal alpha asymmetry (-9.97) suggests heightened reactivity and slower recovery from stress. Your nervous system takes the hit fast and releases it slowly.

□ Learning Capacity

67%

MODERATE

Learning capacity is solid at 67%. Your alpha peak (11.6 Hz) and balanced theta support memory consolidation. Spaced repetition and active recall will work well for you.

□ Creativity

67%

MODERATE

Creativity sits at 67% — moderate. Your brain's high-beta dominance keeps you in execution mode. True creative breakthroughs need low-arousal, open-state thinking. Daily downtime unlocks this.

✦ The hidden link between these three

Emotional resilience, creative insight, and durable learning all depend on the same underlying state: low arousal plus alert alpha. When your nervous system runs hot (as yours does), all three contract. When you protect recovery actively, all three expand — usually together. This is why your 30-day plan focuses on calming, not on adding more.

SECTION 6 — THE NUMBERS BEHIND THE STORY

Deep-dive neuro metrics

The actual EEG values behind every score above — the metrics your clinician will reference.

Alpha Peak Frequency

Optimal: 9.5 – 11.5 Hz

11.6 Hz

HEALTHY

Arousal Score

Optimal: < 1.0

2.24

ELEVATED

Relaxation Score

Optimal: > 8

2.47

LOW

Regeneration (Alpha Modulation)

Optimal: > 30%

20%

LOW

Frontal Alpha Asymmetry

Optimal: Balanced (near 0)

-9.97

RIGHT-SHIFTED

Daytime Delta

Optimal: < 20%

22%

BORDERLINE

① Reading these numbers

The pattern is unmistakable: arousal 2.24, relaxation 2.47, regeneration 20%, frontal asymmetry -9.97, delta 22% — all markers of a Sentinel brain running hot. Yet stress regulation 100% and cognition 67% show your brain is capable and functional. The issue isn't capacity; it's that you're spending more than you're replenishing.

SECTION 7 — YOUR PERSONALIZED PLAN

Your 30-day brain plan

Your 30-day plan targets your core pattern: a nervous system that runs at high alert, recovers slowly, but channels pressure exceptionally well. Small daily inputs — focused on genuine downtime, not more activity — will compound fast when they're type-specific.

Daily non-negotiables (start tomorrow)

1 4-7-8 breathing — twice daily for 4 cycles.
Activates parasympathetic tone.

2 Worry journaling — 10 min before bed. Sentinel brains sleep better when worries are "contained."

3 Box breathing before any high-stakes task.

4 Cognitive reframing — for every "what could go wrong," add "what could go right."

Week-by-week build

WEEK 1 — CALM FIRST

Lock in the daily anchors

Just the anchors above. Prove to your nervous system that calm is safe and consistent.

WEEK 2 — CONTAIN

Add structure & containment

A short evening wind-down and a 3-item morning priority list. Contain the open loops.

WEEK 3 — RECOVER

Add one weekly true-rest session

90 minutes of no productivity, no input, no goal. It will feel uncomfortable — that is the point.

WEEK 4 — ACTIVATE

Layer in performance work

Add a daily goal-activation routine — one intention plus one thing you are looking forward to.

⌚ After 30 days

Regeneration and relaxation scores typically shift first — expect easier mornings and genuine wind-downs within 2-3 weeks. Emotional regulation and focus follow as your baseline arousal lowers and your brain gets the recovery it has been missing.

Your brain is unique. Your plan should be too.

You are starting from a position of real strength. Your brain type has genuine advantages — reliability, follow-through, and the ability to perform under load. The work ahead isn't about fixing what's broken; it's about adding the recovery your high-performing system has been neglecting. Your 30-day plan is the lever. Pull it consistently, and the numbers will move.
